

SWIFT (Secure World Infrastructure Frontier Triage)

1. What is SWIFT?

SWIFT is a hybrid AI cybersecurity platform. It combines pentesting (external view) and code analysis (internal view). It finds real attack paths and helps fix them safely.

2. Core Idea

SWIFT starts from outside like a hacker, then goes inside like a security engineer. It focuses on exploit chains, not just single bugs.

3. How it Works

Step 1: Surface Scan – find exposed systems.

Step 2: Deep Analysis – analyze code and configs.

Step 3: Exploit Chains – connect weaknesses.

Step 4: Safe Proof – validate in sandbox.

Step 5: Remediation – generate patch diffs.

Step 6: Evidence Bundle – full report for teams.

4. Architecture Diagram

5. Safety Design

All actions are logged. Tools run with permissions. No production exploitation. All validation happens in sandbox. Human approval is required.

6. Why SWIFT is Different

Most tools only scan. SWIFT finds real attack paths and fixes them. It combines pentest + code + AI reasoning.

7. One-line Pitch

SWIFT finds real attack paths like a pentester and fixes them like an AI security engineer.
